TV7* - Military Tube Tester

Still today the TV-7 is one of the the most appreciated mutual conductance tube testers. It was introduced as an update of the well known military I-177 of which it retains the compact size. Rugged and reliable, this tube tester uses rotary switches instead of the cables of the I-177. It can be also equipped with special adapters to accept some popular transmitting tubes, as the oil-can 2C39 or the 829.
