

701A – Power Tetrode, Radar Pulse Modulator

Power tetrode intended as radar pulse modulator. Glass bulb, reduced height WE 357A, containing four electrode sets of 350A, with common molibdenum anode. Gold plated control and screen grids. Special four-pin base.

Developed for the pulse modulator of the naval radar sets Mark 3 and 4, to drive the WE 700A to D magnetron.

12.5 kV, 10 A pulse capability, 100 W average plate power.

8 V at 7.5 A heater.

Developed at Bell Labs. during WWII. A comprehensive description of the tube and of its development is given in the [BSTJ volume 26, issue 4, October 1947](#).
