

A-2212 RCA - Developmental UHF Power Triode

- Click to enlarge.

The RCA label tied to the tube states that it is a developmental type. No data or technical information available. Nevertheless its shape and size are quite unique and match exactly those of the registered type [4C33](#) as in the images below. The most relevant visible difference looks to be in the construction of the finned radiator. In the developmental tube it looks to be made by a finned extrusion brazed inside a larger copper or brass tube, while in the production type it looks to be made by L-shaped copper fins brazed all around the inside threaded tube. Minor differences can be also appreciated in the metal to glass seals and in the heater connecting pin. 1944.
