

DV2 Zenith – Early Triode Amplifier

The code on this Zenith tube is deleted. Its yellowish getter speaks of a very early type, made before 1925, quite similar as per electrode structure to the W.E. [215A](#).

It could be one of the tubes designed by Agostino Del Vecchio, who joined Zenith in 1922. Probably the tube is a DV-2.

The tube comes from the collection of Peter den Boer, The Neatherland.
