

## Magnetron Interdigital 12-segments

- Click on the image to enlarge

No info available on this 12 segment interdigital magnetron. On a small label inside the bulb a code, 215, is punched. On the box an inscription 'MOV type B' can be read. Its construction looks crude and quite primitive. It could be one of the early GEC experimental prototypes designed by Eric Megaw in the second half of the thirties, from 1936 to 1937.
