

## TRS3 – Transmitting Triode

.No info found on this triode. We know from the residual writings on the bulb that it was made by Zenith and its filament operates at 4 volts, 0.25 amps.

4-pin European base.

The inverted 'W' shaped filament with tension springs held by a glass stem suggests a construction date around the early thirties. Probably a small transmitting triode for a portable communication set, like the ones supplied to observers on aerostatic balloons.
